Internet …. Tomorrow

Embodied Virtuality (Pervasive Computing)

The most profound technologies are those that disappear. They weave themselves into the fabric of everyday life until they are indistinguishable from it.

Uniquitous, Invisible Computing:
The process of drawing computers out of electronics shells

The virtuality of computer-readable data is **brought into the physical world.**

(Siemens)

Ubiquitous computing reside in the human world and poses no barrier to personal interactions

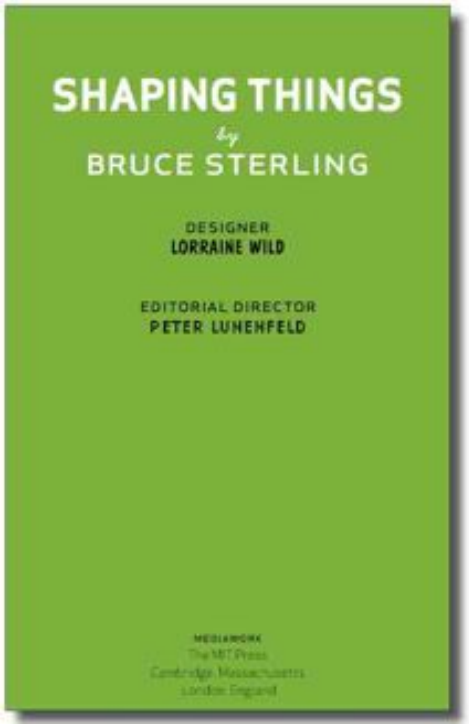
When almost every object contains a computer [..], obtaining information will be trivial

(M. Weiser (PARC), The Computer for the 21st Century, 1991)

University of Roma
Tor Vergata

Internet …. Tomorrow

Spimes



SPIME=SPace + tiME

"Manufactured objects whose informational support is so extensive and rich that they are regarded as material instantiations of an immaterial system.

After the purchase, manufacture, and delivery, the **Spime continuously generates information through interactions** with the surrounding environment".

(B. Sterling, 2005)

University of Roma
Tor Vergata

Internet …. Tomorrow

Planetary Skin

A global "**nervous system**" that will integrate

- land-sensors
- sea-sensors
- air-sensors
- Space sensors

helping the public and private sectors make decisions to prevent and adapt to **climate change**.

(CISCO- NASA, 2009)

RFID:

From visual to Electromagnetic labeling

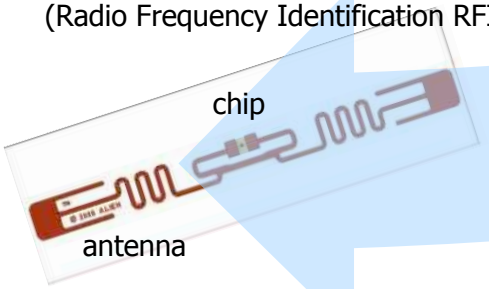
Printed Label

Direct and Visual access to data

Barcode

- Indirect access to data
- Binary coding
- Optical reading by laser scanner
- Reading range: a few cm

Electromagnetic tag
(Radio Frequency Identification RFId)



Electromagentic access to data

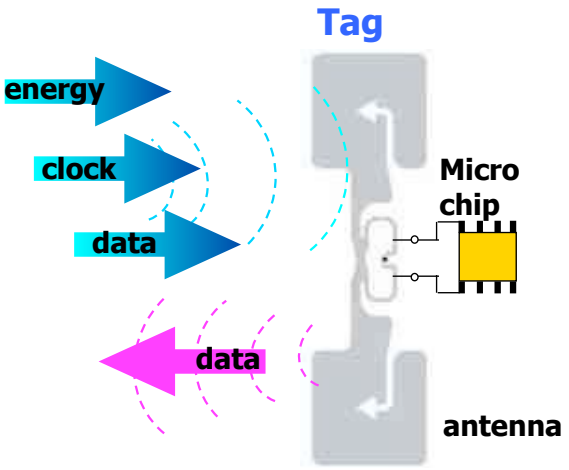
Electronic tag (Magnetic & Smart Cards)

- Data reading by electrical contact or magnetic induction
- Battery-less devices
- Binary coding

University of Roma
Tor Vergata

RadioFrequency Identification (RFID)

Reader



- PASSIVE devices: Tags do not contain a battery; the power is supplied by the reader.
- BACKSCATTERING: Tags reflect the reader's signal right back, modulating the query signal to transmit data.

- Back-scattered data modulation
- **Complex impedance matching**

$$Z_A = Z_C^*$$

University of Roma
Tor Vergata

Labeling:
giving an ID to an object

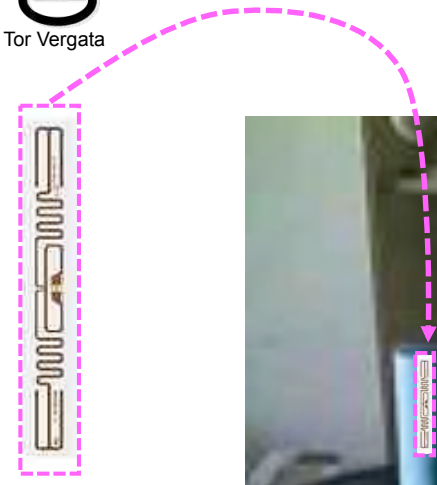
Sensing:
giving a "state" to an object

University of Roma
Tor Vergata

Can we use a sensor-less tag (a bare antenna) to achieve physical information about the tagged object ?

University of Roma
Tor Vergata

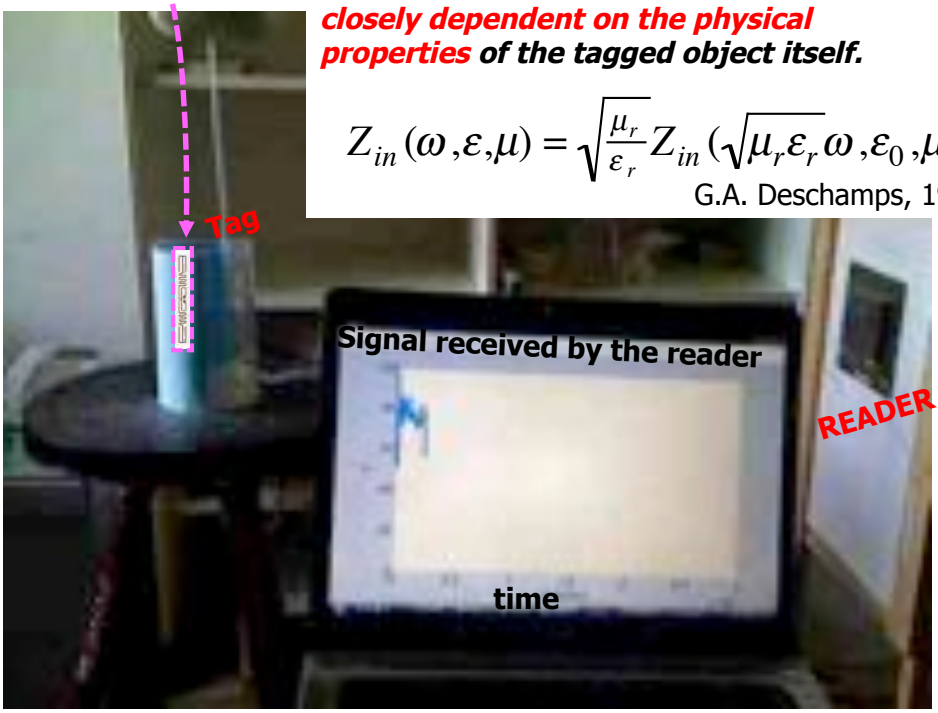
Sensing-Antenna Rationale



The electrical features of a passive RFID transponder placed on a target are closely dependent on the physical properties of the tagged object itself.

$$Z_{in}(\omega,\varepsilon,\mu) = \sqrt{\frac{\mu_r}{\varepsilon_r}} Z_{in}(\sqrt{\mu_r \varepsilon_r}\,\omega, \varepsilon_0, \mu_0)$$

G.A. Deschamps, 1962

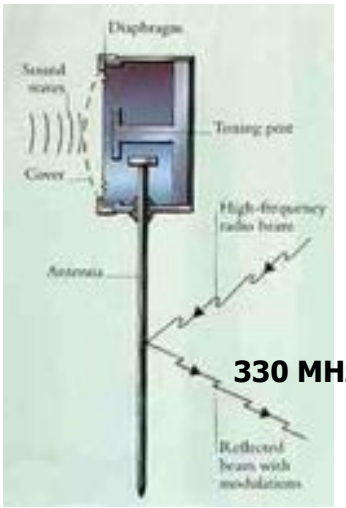


University of Roma
Tor Vergata

Wireless passive sensing devices ?
definitely not a new Idea

Лев Сергеевич Термен
(**Leon Theremin**)
1896, Saint Petersburg
1993, Moscov

The Thing, also known as the Great Seal bug, was one of the **first convert listen device** (or "bugs") to use passive electromagnetic induction to transmit an audio signal.



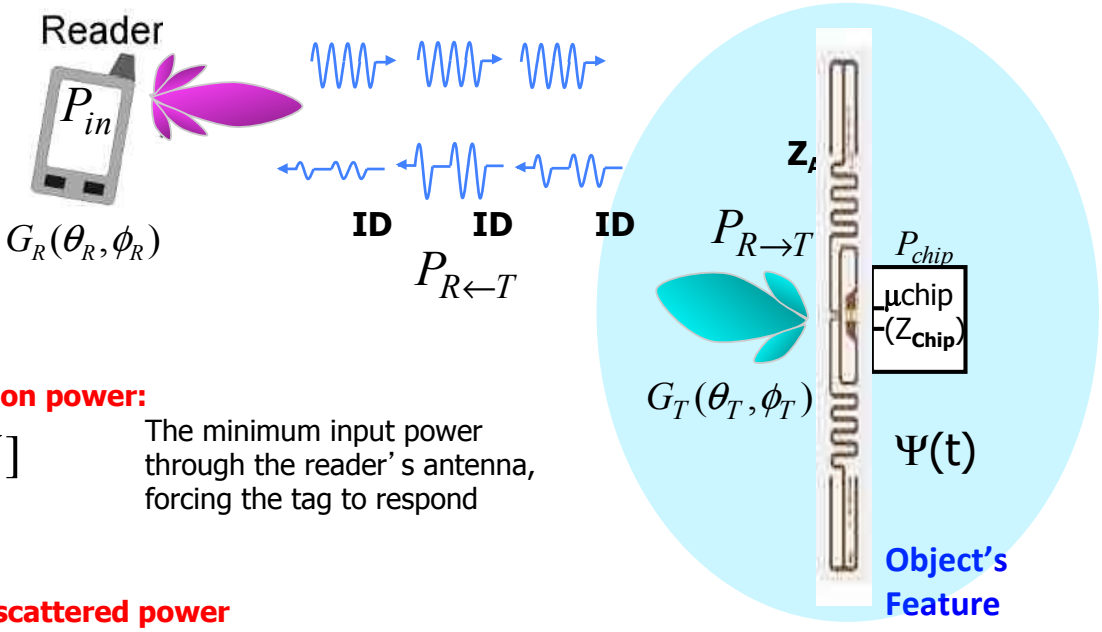
Issued: 1945
Discovered (CIA): 1952
Understood: some years later

Hidden in a **replica of the Great Seal of the United States** carved in wood, in 1945 Soviet school children presented the concealed bug to **U.S. Ambassador** as a "gesture of friendship" to the USSR's World War II ally. **It hung in the ambassador's residential office in Moscow**, and **intercepted confidential conversations** there during the first seven years of the **Cold War**, until **it was accidentally discovered in 1952**

University of Roma
Tor Vergata

What the Reader may measure

- accessible data



1. Turn-on power:

$P_{in}^{to}[\Psi]$ The minimum input power through the reader' s antenna, forcing the tag to respond

2. Backscattered power

$P_{R\leftarrow T}[\Psi]$ (RSSI - received signal strength indication)

Object's Feature
-Geometrical
-Chemical
-physical

University of Roma
Tor Vergata

Basic Sensing Equations

- free space

1. Turn-on (to) power: $P_{in}^{to} = P_{in} \quad when \quad P_{R\rightarrow T} = P_{chip}$

$$P_{in}^{to}[\Psi] = \left(\frac{\lambda_0}{4\pi d}\right)^{-2} \frac{P_{chip}}{G_R(\theta_R,\phi_R)\,\eta_p\,G_T(\theta_T,\phi_T)[\Psi(t)]\,\tau[\Psi(t)]}$$

Friis Eq.

$$\tau_T[\Psi] = \frac{4R_{chip}R_A[\Psi]}{|Z_{chip}+Z_A[\Psi]|^2}$$ Power transfer coefficient

2. Backscattered Power (←RSSI)

$$\frac{P_{R\leftarrow T}[\Psi]}{P_{in}} = \frac{1}{(4\pi)}\left(\frac{\lambda_0}{4\pi d^2}\right)^2 G_R^2(\theta_R,\phi_R)\,\eta_p^2\,\sigma_T(\theta_T,\phi_T)[\Psi(t)]$$

Radar Eq.

$$\sigma_T[\Psi] = \frac{\lambda_0^2}{4\pi}G_T^2[\Psi]\frac{R_A[\Psi]}{R_{chip}}\tau[\Psi]$$ RCS: Radar Cross-section

University of Roma
Tor Vergata

The RFID- Sensing Problem

$$P_{in}^{to}(\Psi, d, \theta_{R,T}, \phi_{R,T}, environment)$$
$$P_{R\leftarrow T}(\Psi, d, \theta_{R,T}, \phi_{R,T}, environment)$$

measurement

Reader-tag position

S-Tags: Electromagnetics Challenges

Sensing has to be mastered, not only discovered and verified as side effect

- The antenna boundary conditions have to be intended as **time-dependent**.
- The geometrical design requires to predict the **antenna response for any state of the process** under observation
- This is similar to the **design of broad-band antennas** wherein frequency is replaced by the state of the process
- The antenna's **geometry** itself my by subjected to **changes** during the process' evolution
- Optimization may be hence time-consuming and involving **multiphysics** background

University of Roma
Tor Vergata

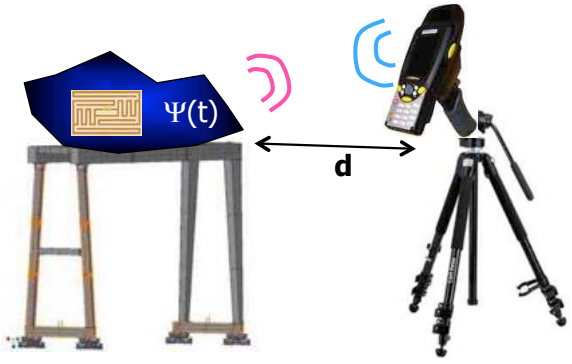
On the Ways Things are sensed

University of Roma
Tor Vergata

Sensing Modes

Stationary sensing

the reader-tag mutual position remains fixed during the continuous interrogation



Inversion curve (backscattering)

$$p_S(\Psi) \equiv \frac{P_{R\leftarrow T}(\Psi)}{P_{R\leftarrow T}(\Psi_0)} \Leftrightarrow \Psi$$

$$= \frac{G_T(\theta',\phi')[\Psi]}{G_T(\theta',\phi')[\Psi_0]} \left(\frac{R_A[\Psi]}{R_A[\Psi_0]} \right)^2 \frac{|Z_{chip} + Z_A[\Psi_0]|^2}{|Z_{chip} + Z_A[\Psi]|^2}$$

Inversion curve (turn-on power)

$$p_{to} = \frac{P^{to}(\Psi)}{P^{to}(\Psi_0)} = \frac{G_T(\theta',\phi')[\Psi_0] \cdot \tau(\Psi_0)}{G_T(\theta',\phi')[\Psi] \cdot \tau(\Psi)}$$

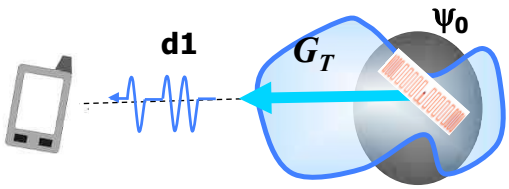
Variation of the Object ⟺ **- Variation of gain**
- Variation of impedance

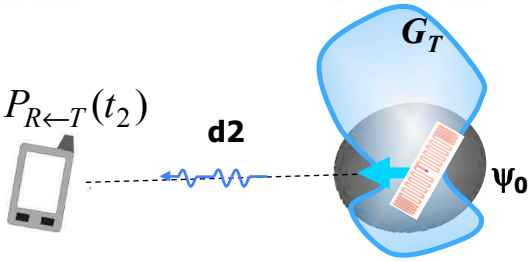
University of Roma
Tor Vergata

Sensing Modes

Non-Stationary sensing

- the position and orientation of reader and tag is unknown or may be changed in successive measurements (manual sweep);
- the surrounding environment has been somehow modified;





First interrogation ($t=t_1$)

Second interrogation ($t=t_2$)

University of Roma
Tor Vergata

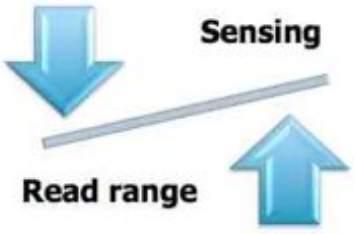
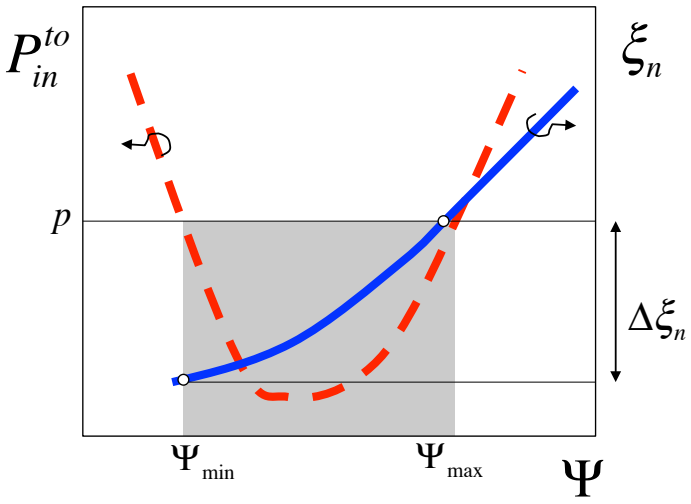
Sensing vs.Communication

Sensing is often obtained at the expenses of read-distance degradation





1. Communication with the allowed power

$$P_{in}^{to}[\Psi] \le p \qquad \Psi \in R$$

2. Dynamic range of the sensing indicator

$$\Delta\xi = \left|\xi[\Psi_{max}] - \xi[\Psi_{min}]\right|_{dB} > R$$

University of Roma
Tor Vergata

Sensing and Communication

A Chart

A possible parametrization:

$\tau(r_a, x_a)$ $\quad$ $AID(r_a, x_a)$

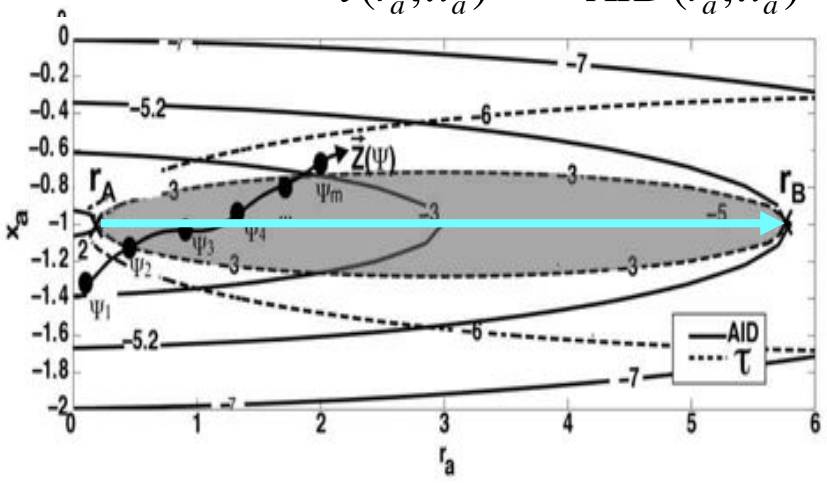
read distance ↔ τ

sensing ↔ **AID**

Any process in evolution involving a change of the Antenna impedance can be **traced** onto the chart

$$r_a = \frac{R_a}{R_{chip}} \quad x_a = \frac{X_a}{X_{chip}}$$

$$Q = \frac{|X_{chip}|}{R_{chip}}$$



$$\vec{\mathbf{Z}}(\Psi) = r_a(\Psi)\hat{i} + x_a(\Psi)\hat{j} \quad \in R^2$$

$f \leftrightarrow \Psi$

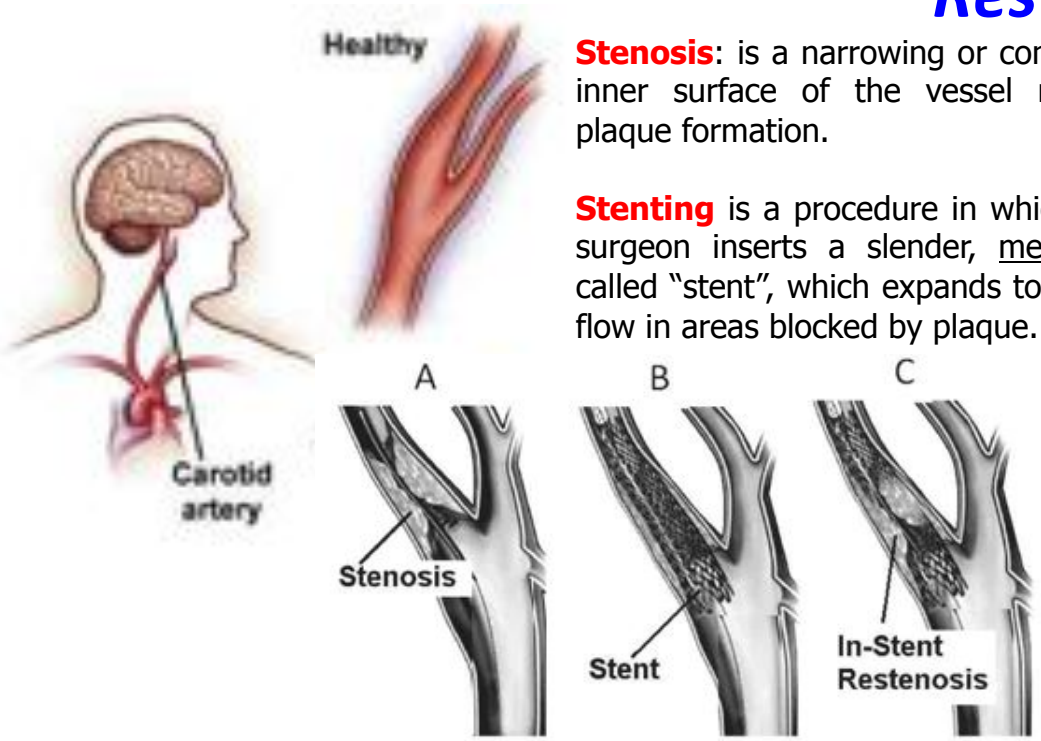
Vascular Stenosis and Restenosis

Stenosis: is a narrowing or constriction of the inner surface of the vessel mainly due to plaque formation.

Stenting is a procedure in which the vascular surgeon inserts a slender, metal-mesh tube, called "stent", which expands to increase blood flow in areas blocked by plaque.



University of Roma
Tor Vergata

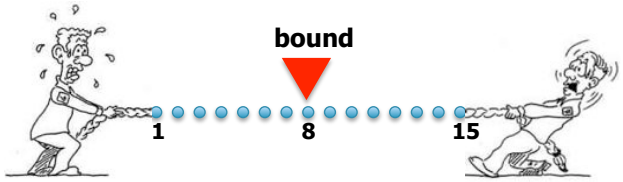
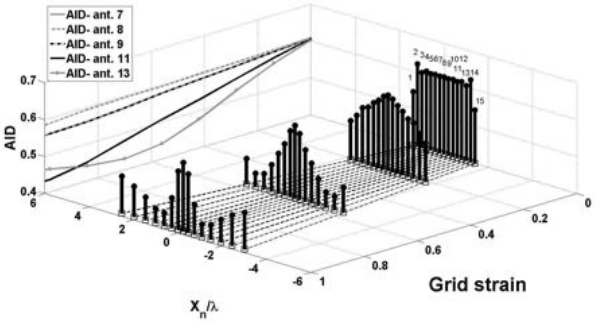
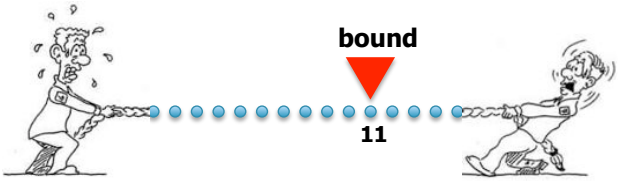
S. Caizzone, G. Marrocco, **"RFID Grids – Part II: Experimentations"**, *IEEE Trans. Antennas. Propagat*, 2011

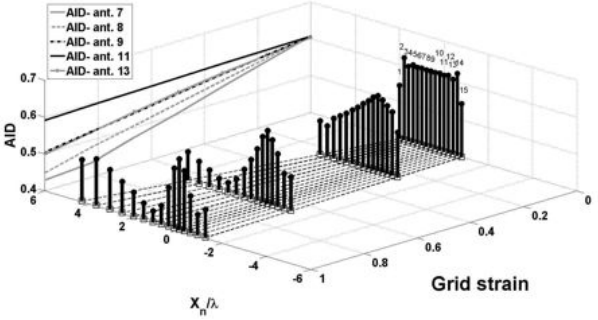
Applications
Localizing deformations



f=870 MHz

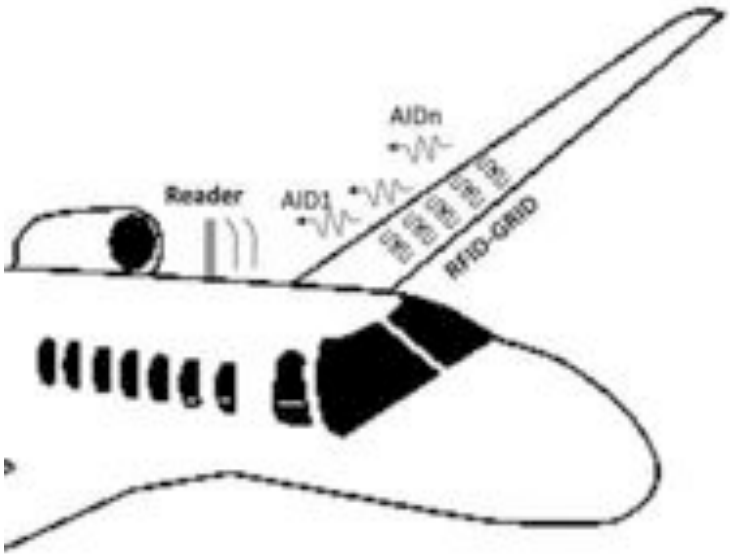






Possibility to recognize the position of a crack

Applications
Deformation Sensing

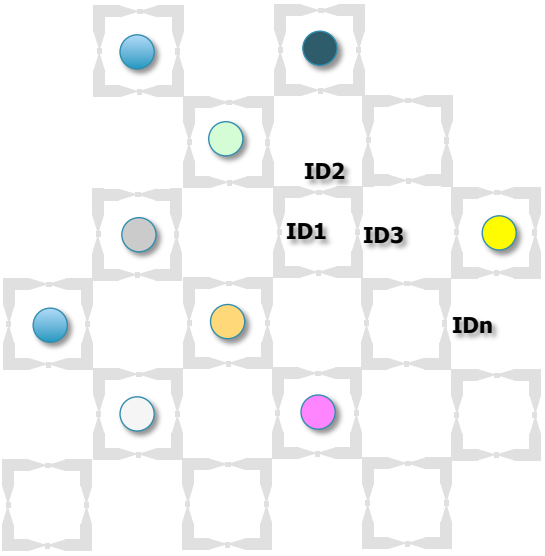


University of Roma
Tor Vergata

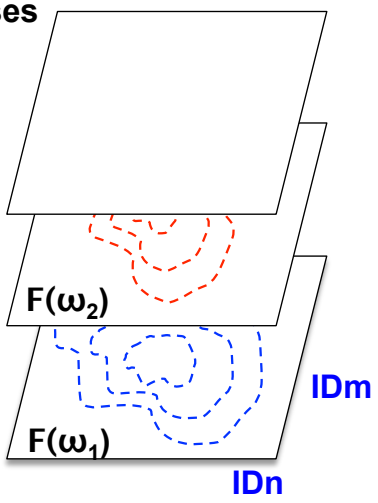
Applications

Lab-on-Tag

Smart skin



Grid IDs localize the multiple responses



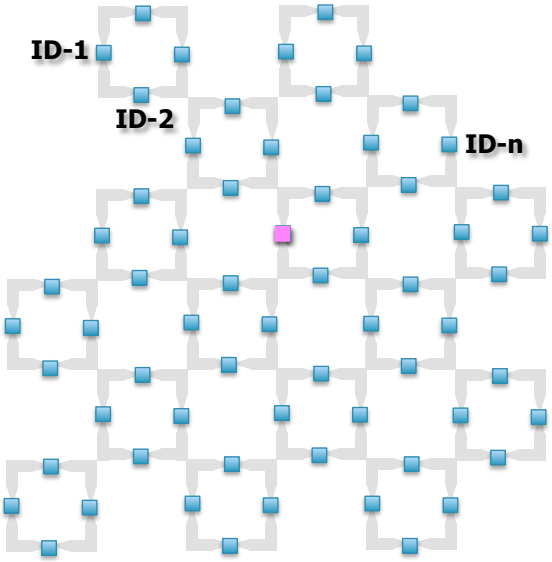
Conductors may be doped by several species of chemical receptors. It is conceivable to develop **smart self-sensing skins** suited to envelope things, plants and even body regions.

University of Roma
Tor Vergata

Applications

Distributed Wireless Access Memory

- **Memory node**
- **Index node (list of the sequence of IDs)**



- The grid is seen as a memory matrix wherein complex data are decomposed into packets and stored into the micro-chips' EPROM.
- Packets are recomposed by the Reader according to the list of IDs stored into the Index node.

Augmented version of a 2D-barcode

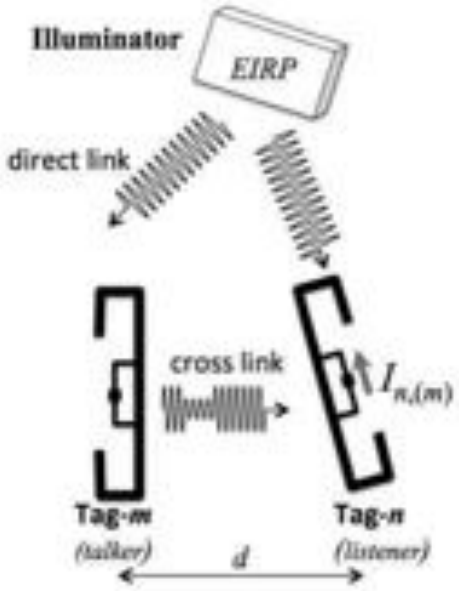
Tag 2 Tag Communication

Tags placed in close proximity may in principle directly communicate even in the absence of an RFID reader.

What is required is just an **illuminator** radiating a continuous wave able to power up the tags.

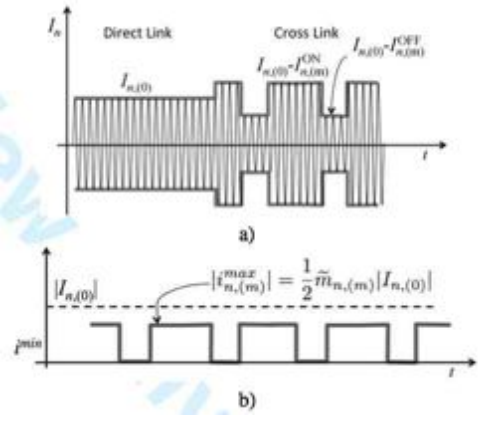
They could hence **communicate through backscattering modulation** of such a CW carrier.

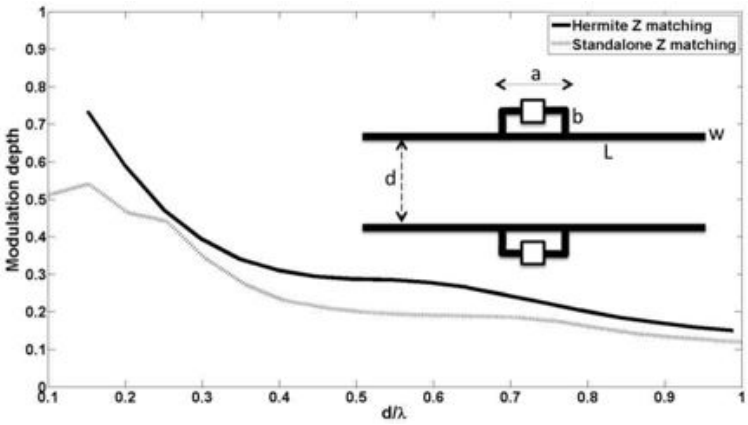
(Nikitin, Rao and Lam, 2010)



University of Roma
Tor Vergata

Tag 2 Tag Communication





The performance parameter is the **modulation depth** which degrades along with the distance. It can be improved by mastering electromagnetic coupling

$$\tilde{m}_{n,(m)} = \frac{|Y_{G,mn}|}{|Y_{G,mm}|}\sqrt{\frac{\tilde{G}_m}{\tilde{G}_n}} \qquad BER_{n,(m)} = \frac{1}{2}erfc\left(\frac{|I_{n,(0)}|\tilde{m}_{n,(m)}}{2\sqrt{2\sigma}}\right)$$

S. Caizzone, G. Marrocco, "**Eletromagnetic Models for Passive RFID Tag-to-Tag Communications**", IEEE-TAP, under reviews

University of Roma
Tor Vergata

Tag 2 Tag Communication

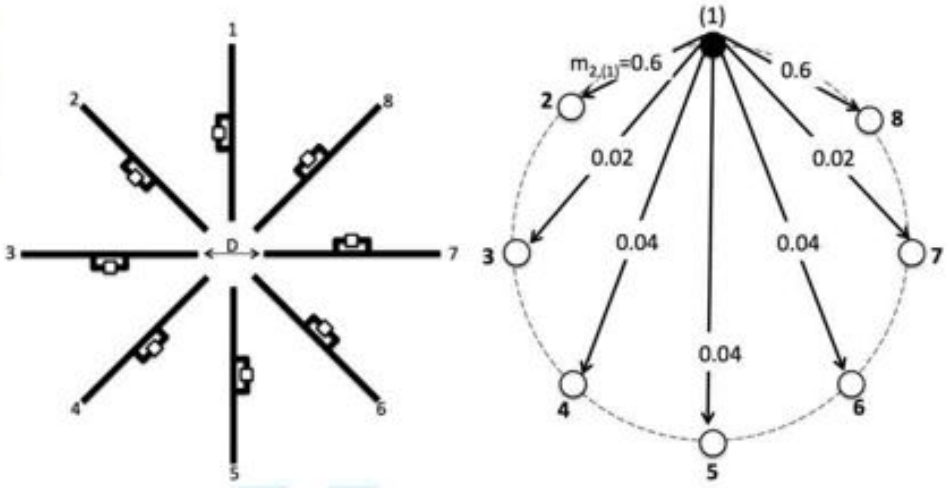


Figure 10. A circular grid of equal dipoles with distance D=40mm. right) Modulation index $\tilde{m}_{n,(1)}$ when the tag m=1 is talking.

University of Roma
Tor Vergata

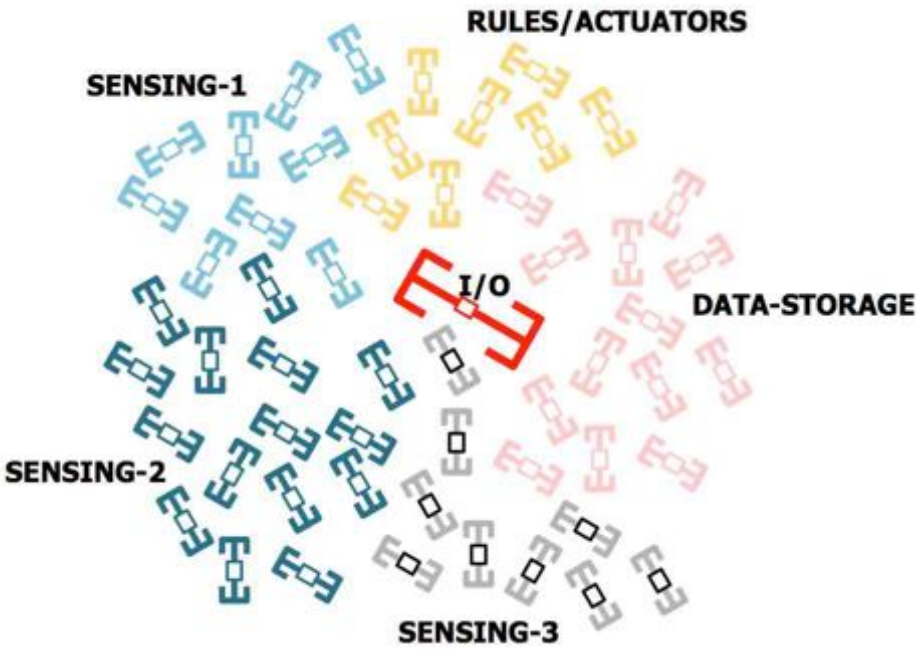
Tag 2 Tag Communication

Distributed computing

Random coalition of tags

Information and commands **percolate** from each node to the master.

The system could be anyway **scalable**

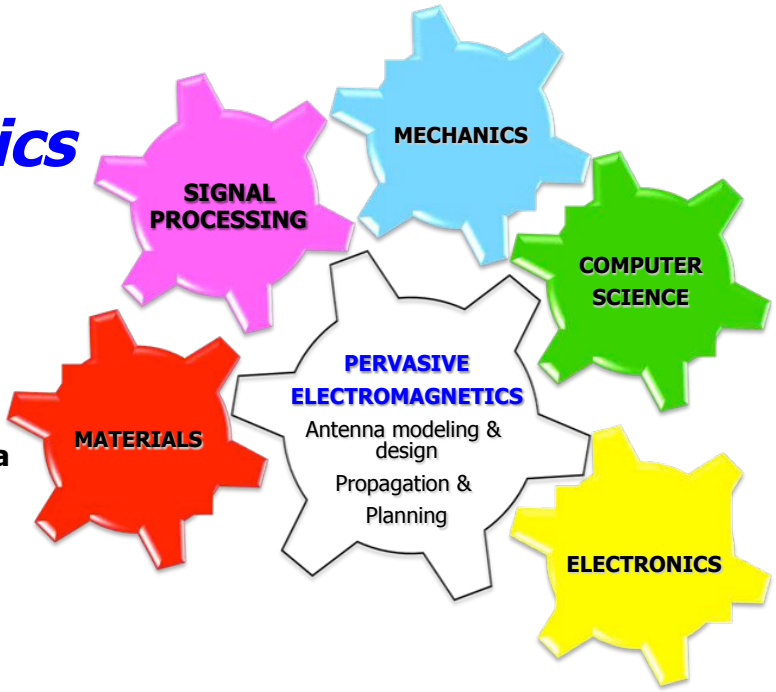


University of Roma
Tor Vergata

The research on the basic physics of data-capture, tag design, together with the low-level data processing can be considered as a particular edge discipline, a

Pervasive Electromagnetics

- different from the well assessed Remote Sensing, generally based onto the raw scattering from objects,
- addresses seamlessly **both the design of devices and the data processing**
- may profit by the digital intelligence distributed into the Things.



University of Roma
Tor Vergata

Conclusion

- **RFID chemical sensors** could have a great commercial interest thanks to the fabrication simplicity and for the potential mass diffusion in food and pharma control chains.
- The design of S-tags is **not yet a mature discipline** since unified methodologies are still required to efficiently handle multi-physics optimization. **More on data processing**
- Reduction of the chip sensitivity and improvement in reader's resolution,
- Multi-chip systems (**grids**, **tag to tag** passive communications) ➔ distributed computing
- Integration with **smartphones** with unpredictable applications in the distributed or ubiquitous computing boosting the evolution of the Internet of Things.

IEEE International Conference on RFID-Technology and Applications 2012 is the third edition of RFID-TA events. It provides an excellent opportunity for researchers and engineers to communicate their advancement on RFID technology and its numerous applications. The conference aims to fill the gap between academic advances and technology transfer to industry. IEEE-RFID TA 2012 will contribute to strengthen collaboration and partnership between research labs and centers, public institutions and industry. The conference is sponsored by the IEEE Technical Committee on RFID (CRFID) and supported by several institutions and companies.

For the first time, RFID-TA will be co-located with the rapidly emerging "International RFID Congress" organized by the French Centre National RFID (CNRFID). Both events will be held on November 5-7, 2012 @ Palais de la Méditerranée in the exciting and the very attractive city of NICE on the French Côte D'Azur.
